INTERFACES, INTERACTIONS & A LITTLE ADVENTURE

Thoughtful interfaces. Playful experiences.

I am Cendikia Hairy. This portfolio explores my work through Fight the Dragon: a browser-based experience that brings team challenges, live scores, and a fantasy world together.

FEATURED PROJECT

Fight the Dragon.

An offline-first command center for the host running the room and the audience following every turn.

EXPERIENCE

Host console + public display
Installable web application

FOUNDATION

React, TypeScript, Vite
SQLite in the browser

LET'S CONNECT

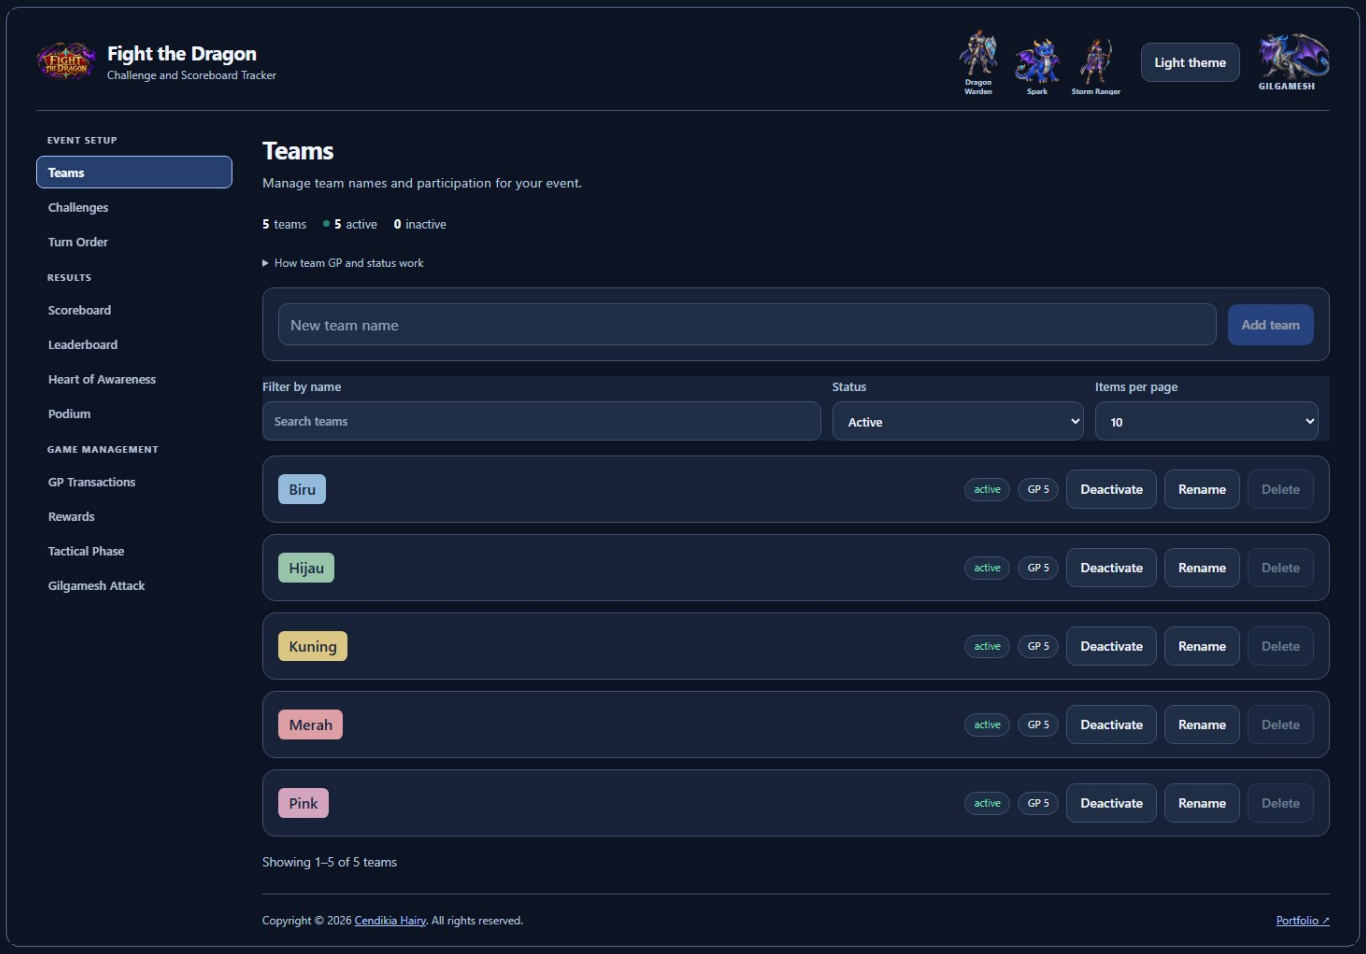

linkedin.com/in/cendikia-hairy

ONE EVENT. TWO PERSPECTIVES.

Keep the event moving.
Keep the room engaged.

Team events need precise controls for the host and a clear view for everyone playing. Fight the Dragon connects both through shared local state and dedicated presentation screens.

THE HOST WORKSPACE

Demo state with the five default teams. Navigation groups event setup, results, and game management.

Prepare

Set up teams and turn order.

Play

Decode clues, match cards, and face the dragon.

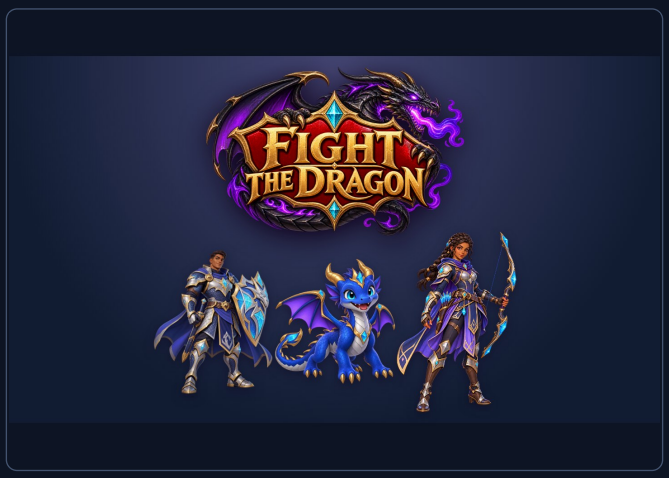

Celebrate

Show rankings, rewards, and the final podium.

THE DETAILS ARE PART OF THE EXPERIENCE.

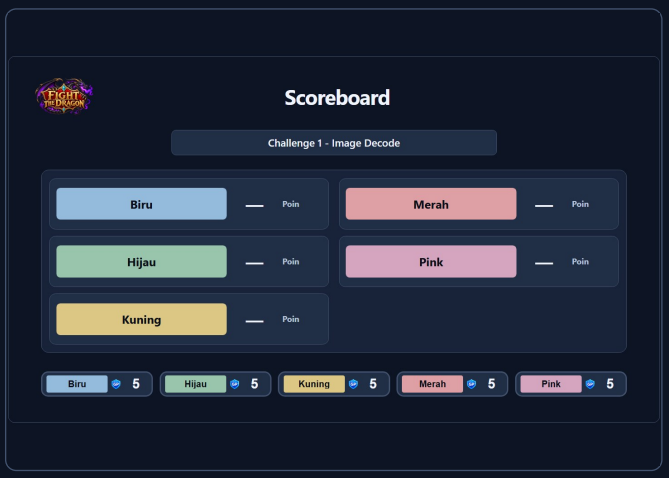

Built for the whole room.

A shared navy, cobalt, silver, and cyan visual system connects host tools, public displays, and the cast. Light and dark appearances keep controls and reading panels consistent.

Audience presentation

Demo screenshots / default event state

Live scoreboard

01 Interface engineering

Responsive React views, typed components, shared appearance tokens, visible keyboard focus, and reduced-motion support.

02 Dependable local state

Sequelize models and sql.js run SQLite in the browser. Local persistence and same-origin, same-profile tab synchronization keep the host and audience connected.

03 Traceable game behavior

Persisted scoring, card effects, and duplicate-submission protection support the event loop. A GP ledger records balance changes; Vitest and Playwright verify rules and interactions.
